

# Climate change disinformation & propaganda

Disinformation  
Propaganda  
Lobbying

The primary bottleneck to tackling climate change is no longer science, technology, or policy know-how. It is the lack of social and political will to act.

Funded opportunities exist for students to investigate climate change disinformation and propaganda using environmental data science techniques, and to inform outreach and engagement initiatives to hold bad actors accountable. Projects include the corporate capture of academia, the revolving door between fossil fuel interests and government agencies, and digital climate deception on social media.
